

[Name of the document] ABSTRACT

A purpose of the present invention relate to provide a method for constructing an original support on which a DNA (Deoxyribonucleic Acid) library and others are immobilized by utilizing micro amount of DNA test material, a method for constructing its replica supports and a support on which a duplicated DNA piece is immobilized in a molecular biological technology and/or a biochemical technology such as a gene technology, a protein technology, a cell technology and immunology. In a method for constructing a cDNA (complemetary DNA) library according to the present invention, Reverse Transcriptase enzyme is affected so as to immobilize the complementary DNA on a support after hybridizing mRNA (messenger RNA). Alternatively, mRNA is dehybridized from a cDNA library immobilized on a support and then the same cDNA library is immobilized on a support by utilizing the mRNA. In a method for constructing a genomic DNA (gDNA) library, a double stranded gDNA is ligased, the gDNA library is immobilized on a support. Alternatively, after the ligation of the double stranded gDNA, a sense portion of the gDNA is immobilized on a support. After dehybridizing an anti-sense portion of the gDNA library, the anti-sense portion is immobilized on a support.
